

## 2014 Post-Implementation Prerequisite Validation Studies

Part II: Examination of the Effectiveness of Current Prerequisites in Chemistry and Physics

# 2014 Post-Implementation Prerequisite Validation Studies 

## Part II: Examination of the Effectiveness of Current Prerequisites

## Introduction

Title 5 Education Code requires that interdisciplinary course prerequisites are reviewed every six years [§55003(b)(4)]. In addition to examining the impact of the prerequisite, the college is also required to examine disproportionate impact [§ 55003 (g)(2)]. Title 5 [§ 55502 (e)] defines disproportionate impact as occurring "...when the percentage of persons from a particular racial, ethnic, gender, age or disability group who are directed to a particular service or placement based on an assessment instrument, method, or procedure is significantly different from the representation of that group in the population of persons being assessed, and that discrepancy is not justified by empirical evidence demonstrating that the assessment instrument, method or procedure is a valid and reliable predictor of performance in the relevant educational setting."

The Crafton Hills College (CHC) Office of Institutional Effectiveness, Research, and Planning (OIERP) is in the process of examining the effectiveness of prerequisites that have been implemented from fall 2000 to fall 2012. Part II examines the effectiveness of course prerequisites for the following target courses:

Table 1: Part II Target Courses, Course Title, Current Prerequisites, and Term Prerequisites were implemented.

| Target Course | Target Course Title | Current Prerequisite | Term Implemented |
| :--- | :--- | :--- | :--- |
| CHEM-101 | Introduction to Chemistry | MATH-090/C | 2000FA |
| CHEM-150 | General Chemistry I | MATH-095/C | 2000FA |
| PHYSIC-110 | General Physics I | MATH-103 or Eligibility for 160 | 2011FA |

Part I examined the effectiveness of course prerequisites for the following target courses, and the research for Part I was illustrated in a separate report:

Table 2: Part I Target Courses, Course Title, Current Prerequisites, and Term Prerequisites were implemented.

| Target Course | Target Course Title | Current Prerequisite |
| :--- | :--- | :--- |
| BIOL-130 | Cell and Molecular Biology | CHEM-101 or 150 \& MATH-095 |
| BIOL-131 | Populations and Organisms | MATH-095/C |
| JOUR-120 | Fundamentals of News Writing | ENGL-010/015 |
| MICRO-150 | Medical Microbiology | CHEM-101or 150 |
| PSYCH-108 | Statistics | MATH-095/C |
| THART-226 | Play and Screenplay Analysis | ENGL-010/015 |

## Summary of Results

1. Did the target course success rates increase after the prerequisites were implemented?

The success rates increased after the prerequisite was implemented for all three targe $\dagger$ courses examined.

| Target Course | Increase | Substantial | Significant |
| :--- | :---: | :---: | :---: |
| CHEM-101 | Yes | Yes | Yes |
| CHEM-150 | Yes | Yes | Yes |
| PHYSIC-110 | Yes | No | No |

Note: Increase refers to whether or not there was an increase in the target course success rate, substantial refers to whether or not the change in the target course success rate had an effect size that was .20 or higher, and significant refers to a statistically significant ( $p<.05$ ) change in the target course success rate from pre- to postimplementation of the prerequisite(s).
2. What is the racial/age/gender/disability makeup of the course post implementation compared to pre implementation?

One common finding across the target courses was an increase in the proportion of Hispanic student's post-implementation than pre-implementation, which mirrors the increase in the proportion of Hispanic student's campus wide at Crafton. The increase was statistically significant in CHEM-101 and CHEM-150.
3. Does the increased success of students in each protected category support the implementation if indeed the percentages of students in each group have changed?

Yes, in general, female students, Asian Students, and Hispanic Students were substantially (ES >= .20) and statistically significantly ( $p<.05$ ) more likely to successfully complete the target course if they had met the prerequisite than students who had not met the prerequisite.
4. Was there disproportionate impact?

No, disproportionate impact was not indicated for any of the target courses.
5. What effect did the implementation have on overall course enrollment?

The overall course enrollment in all three courses increased after the implementation of the prerequisites for each course.

The results presented here support keeping the prerequisites in place for each of the three target courses. The target course success rates increased after the prerequisite was implemented for each of the target courses.

## Findings

Question 1: Did the target course success rates increase after the prerequisite was implemented?
One of the main concerns after implementing a prerequisite for a target course is whether the students who were required to meet the prerequisite had an increased likelihood of successfully completing the target course. The target course prerequisites have been in place for different periods of time, and, as a result, the time frame for examining the success rate prior to the prerequisite varied for each target course. If the time frame post-implementation occurred five years or less from the current complete year (i.e. 2013-2014), then the same amount of time postimplementation was matched with the pre-implementation time frame. As an illustration, the prerequisite for PHYSIC-110 was implemented in Fall 2011. The time from Fall 2011 to the current complete year was three years; therefore, the pre-implementation time frame in which the postimplementation success rate was compared to, was also three years. If the pre-requisite was implemented six or more years from the most recent complete year (i.e. 2013-2014) then the time frame pre-implementation was only the three most recent years to help control for recency of the curriculum. In addition, only students enrolled in the target courses in primary terms (i.e. fall and spring) were included in the study to control for higher success rates in summer semesters, which are most likely a result of the type of student who chooses to enroll in summer courses.

Table 3: Target Courses, Term Prerequisite Established, and Time Frame Examined Pre- and PostImplementation.

| Target <br> Course | Prerequisite <br> Course | Term Prerequisite <br> Established | Time Frame Pre- <br> Implementation | Time Frame Post- <br> Implementation |
| :--- | :--- | :---: | :---: | :---: |
| CHEM-101 | MATH-090/C | 2000FA | $1997-98$ to 1999-00 | $2000-01$ to 2013-14 |
| CHEM-150 | MATH-095/C | 2000FA | $1997-98$ to 1999-00 | $2000-01$ to 2013-14 |
| PHYSIC-110 | MATH-103 or <br> Eligibility for 160 | 2011FA | $2008-09$ to 2010-11 | 2011 -12 to 2013-14 |

The performance of the students who earned a GOR in the target courses specified in Table 3 post-implementation was compared to students who earned a GOR in the target course preimplementation in primary terms only. The effect size statistic was used to indicate the size of the difference on course success for students who were required to meet the prerequisite postimplementation and students who earned a grade on record (GOR, A, B, C, D, F, I, NP, P, or W) in each target course prior to the implementation of the prerequisite. One method of interpreting effect size was developed by Jacob Cohen. Jacob Cohen defined "small," "medium," and "large" effect sizes. He explained that an effect size of .20 can be considered small, an effect size of .50 can be considered medium, and an effect size of .80 can be considered large. An effect size is considered to be meaningful if it is .20 or higher. It is important to mention that the number of students in each group does not influence Effect Size; whereas, when statistical significance is calculated, the number of students in each group does influence the significance level (i.e. "p" value being lower than .05).

Referring to Table 3A, students who were required to complete the prerequisites for CHEM-101 and 150 were statistically significantly ( $\mathrm{p}<.01$ ) and substantially (ES >= .20) more likely to successfully complete CHEM-101 (76\%) and CHEM-150 (78\%) than students who were not required to complete
the prerequisite for CHEM-101 (53\%) and CHEM-150 (69\%). Students who were required to complete the prerequisite for PHYSIC-110 were more likely to successfully complete the course (67\%) than students who were not required to complete the prerequisite (61\%) although the increase was neither substantial nor significant. Notably, only one section of PHYSIC-110 is offered each academic year, which limited the total number of students who could take the course.

Table 3A: Target Course Success Rates Pre- and Post-Implementation of the Prerequisite Courses.

| Target Course | Success Rate |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Pre-Implementation | Post-Implementation |  |  |  |  |  |  |
|  | $\#$ | N | $\%$ | $\#$ |  | $\%$ | ES | P Value |
| CHEM-101 | 390 | 737 | 52.9 | 3,336 | 4,414 | 75.6 | .51 | $<.001$ |
| CHEM-150 | 129 | 188 | 68.6 | 1,071 | 1,374 | 78.0 | .22 | .009 |
| PHYSIC-110 | 25 | 41 | 61.0 | 30 | 45 | 66.7 | .12 | .589 |

Question 2: What is the racial/age/gender/disability makeup of the course post implementation compared to pre implementation?
Proportionally, gender and disability were not statistically significantly ( $p<.05$ ) higher or lower from pre-implementation to post-implementation of the prerequisite for CHEM-101, CHEM-150, and PHYSIC-110 (see Tables $4-4 \mathrm{~B}$ ). There was a statistically significantly ( $\mathrm{p}<.05$ ) higher proportion of students for the following target course demographics:

- A higher proportion of Hispanic students (30\%) enrolled in CHEM-101 after the prerequisite was implemented than prior to when the prerequisite was implemented ( $18 \%$, see Table 4)
- A higher proportion of Hispanic students (27\%) enrolled in CHEM-150 after the prerequisite was implemented than prior to when the prerequisite was implemented ( $16 \%$, see Table 4A)
The increase in the proportion of Hispanic students mirrors the increase in the proportion of Hispanic student's campus wide, which has increased every year for the last ten years.

There were also statistically significant ( $p<.05$ ) lower proportions of students for the following target course demographics:

- A lower proportion of Caucasian students (53\%) enrolled in CHEM-101 after the prerequisite was implemented than prior to when the prerequisite was implemented ( $66 \%$, see Table 4)
- A lower proportion of students $30-34$ years old (6\%) enrolled in CHEM-101 after the prerequisite was implemented than prior to when the prerequisite was implemented ( $9 \%$, see Table 4)
- A lower proportion of Caucasian students (51\%) enrolled in CHEM-150 after the prerequisite was implemented than prior to when the prerequisite was implemented (63\%, see Table 4A)
- A lower proportion of students $30-34$ years old (15\%) enrolled in PHYSIC-110 after the prerequisite was implemented than prior to when the prerequisite was implemented $(2 \%$, see Table 4B)

Table 4: Gender, Ethnicity, and Age Pre- and Post-Implementation of MATH-090/C as the Prerequisite to CHEM-101.

| Demographic Characteristics | Pre- <br> Implementation |  | Post- <br> Implementation |  | Total |  |

| 50 or older | 3 | 0.4 | 40 | 0.9 | 43 | 0.8 |
| Total | 737 | 100.0 | 4,414 | 100.0 | 5,151 | 100.0 |

a - The proportion of Hispanic students was statistically significantly ( $p<.05$ ) higher post-implementation (29.5\%) than preimplementation ( $17.8 \%$ ) of the prerequisite.
b - The proportion of Caucasian students was statistically significantly ( $\mathrm{p}<.05$ ) lower post-implementation ( $53.3 \%$ ) than preimplementation ( $66.4 \%$ ) of the prerequisite.
c - The proportion of students 30 to 34 years old was statistically significantly ( $\mathrm{p}<.05$ ) lower post-implementation ( $6.3 \%$ ) than pre-implementation (8.8\%) of the prerequisite.

| Total | 41 | 100.0 | 45 | 100.0 | 86 | 100.0 |

a - The proportion of students 30 to 34 years old was statistically significantly ( $\mathrm{p}<.05$ ) lower post-implementation ( $14.6 \%$ ) than pre-implementation (2.2\%) of the prerequisite.

## Question 3: Does the increased success of students in each protected category support the implementation, if indeed the percentages of students in each group have changed?

The increased success of students in protected categories supports the implementation of the prerequisite for all three target courses.

- CHEM-101 (see Table 5)
- Female students who successfully completed the prerequisite were statistically significantly ( $\mathrm{p}<.001$ ) and substantially (ES $=.51$ ) more likely to successfully complete CHEM-101 (76\%) than female students who had not successfully completed the prerequisite (54\%)
- African American students who successfully completed the prerequisite were statistically significantly ( $p=.002$ ) and substantially ( $\mathrm{ES}=.55$ ) more likely to successfully complete CHEM-101 (72\%) than African American students who had not successfully completed the prerequisite (46\%)
- Hispanic students who successfully completed the prerequisite were statistically significantly ( $\mathrm{p}<.001$ ) and substantially (ES = .60) more likely to successfully complete CHEM-101 (72\%) than Hispanic students who had not successfully completed the prerequisite (44\%)
- Native American students who successfully completed the prerequisite were statistically significantly ( $p=.050$ ) and substantially ( $\mathrm{ES}=.67$ ) more likely to successfully complete CHEM-101 (73\%) than Hispanic students who had not successfully completed the prerequisite (42\%)
- 19 or younger students who successfully completed the prerequisite were statistically significantly ( $\mathrm{p}<.001$ ) and significantly (ES = .45) more likely to successfully complete CHEM-101 (74\%) than 19 or younger students who had not successfully completed the prerequisite (54\%)
- 20-24 year old students who successfully completed the prerequisite were statistically significantly ( $\mathrm{p}<.001$ ) and substantially (ES = .58) more likely to successfully complete CHEM-101 (74\%) than 20-24 year old students who had not successfully completed the prerequisite (47\%)
- CHEM-150 (see Table 5A)
- Female students who successfully completed the prerequisite were statistically significantly ( $p=.006$ ) and substantially (ES = .35) more likely to successfully complete CHEM-150 (79\%) than female students who had not successfully completed the prerequisite (64\%)
- 19 or younger students who successfully completed the prerequisite were statistically significantly ( $p=.014$ ) and substantially (ES = .38) more likely to successfully complete CHEM-150 (78\%) than 19 or younger students who had not successfully completed the prerequisite (62\%)
- 20-24 year old students who successfully completed the prerequisite were statistically significantly ( $\mathrm{p}<.001$ ) and substantially ( $\mathrm{ES}=.76$ ) more likely to successfully complete CHEM-150 (95\%) than 20-24 year old students who had not successfully completed the prerequisite ( $75 \%$ )
- PHYSIC-110 (see Table 5C)
- Female students who successfully completed the prerequisite substantially (ES = .50) more likely to successfully complete PHYSIC-110 (82\%) than female students who had not successfully completed the prerequisite (59\%)
- Hispanic students who successfully completed the prerequisite were substantially (ES = .81) more likely to successfully complete PHYSIC-110 (83\%) than Native American students who had not successfully completed the prerequisite (44\%)

Table 5: CHEM-101 Success Rates Pre- and Post-Implementation of MATH-090/C as the Prerequisite to CHEM-101 by Gender, Ethnicity, and Age.

## Question 4: Was there disproportionate impact?

In addition to providing evidence that the proposed prerequisite is "such that a student who has not met the prerequisite is highly unlikely to receive a satisfactory grade in the course" [Title 5, §5503(d)(2)], Title 5 regulations also state that the district should conduct, "...an evaluation to determine whether the prerequisite or corequisite has a disproportionate impact on particular groups of students described in terms of race, ethnicity, gender, age or disability, as defined by the Chancellor. When there is a disproportionate impact on any such group of students, the district shall, in consultation with the Chancellor, develop and implement a plan setting forth the steps the district will take to correct the disproportionate impact." [Title 5, §55003(g)(2)]. To clarify, the Chancellor's Office has operationally defined disproportionate impact, stating that it occurs when, "...the percentage of persons from a particular racial, ethnic, gender, age or disability group who are directed to a particular service or placement based on an assessment instrument, method or procedure is significantly different than the representation of that group in the population of persons being assessed and that discrepancy is not justified by empirical evidence demonstrating that the assessment instrument, method or procedure is a valid and reliable predictor of performance in the relevant educational setting [Title 5, §55502(d)]."

A useful statistical model in analyzing disproportionate impact is classification and regression tree (CART) modeling, a statistical application that is useful in situations in which the overall goal is to divide a population into segments that differ with respect to a designated criterion. In short, CART modeling affords researchers the opportunity to examine the interaction and impact of a number of distinct categorical predictor variables (e.g., gender, ethnicity, and age) on a categorical dependent variable (e.g., met prerequisite/did not meet prerequisite). CART modeling initially identifies the best predictor variable, conducting a splitting algorithm that further identifies additional statistically significant predictor variables and splits these variables into smaller subgroups. CART modeling merges categories of a predictor variable that are not significantly different. This merging, combined with the splitting algorithm, ensures that cases in the same segment are homogeneous with respect to the segmentation criterion, while cases in different segments tend to be heterogeneous with respect to the segmentation criterion. As it applies to disproportionate impact, CART modeling has a number of distinct advantages over traditional statistical applications used to examine categorical data (e.g., chi-square, cluster analysis, etc.). Utilizing CART modeling, researchers can easily determine whether specific aspects of numerous categorical predictor variables merge to provide a more accurate identification of populations experiencing disproportionate impact (e.g., male Latino students under twenty-one years of age, female Asian students 30 to 34 years of age, etc.).

As it pertains to this study, CART modeling was conducted to determine whether specific student populations disproportionately earned a GOR in the target courses pre- and/or postimplementation. The following predictor variables were entered into each CART model:

Gender:
Group 1) Male
Group 2) Female
Group 3) Unknown/No Response

Ethnicity:
Group 1) Asian
Group 2) African American
Group 3) Caucasian
Group 4) Hispanic
Group 5) Native American
Group 6) Caucasian
Group 7) Unknown/No Response

Age:
Group 1) 19 or Younger
Group 2) 20 to 24 Years of Age
Group 3) 25 to 29 Years of Age
Group 4) 30 to 34 Years of Age
Group 5) 35 to 39 Years of Age
Group 6) 40 to 49 Years of Age
Group 7) 50 Years of Age or Older
Disability:
Group 1) Students Who Do Not Have Disabilities
Group 2) Students With Disabilities

To examine whether disproportionate impact existed, one CART model was generated for each target course to compare the demographic characters pre- and post-implementation of the prerequisite.

Disproportionate impact was not indicated for any of the target courses examined: CHEM-101,

Figure 1 uses segmentation modeling to identify disproportionate impact when MATH-090/C was and was not the prerequisite for CHEM-101. The segmentation model indicates that disproportionate impact does not exist by gender, ethnicity, age, and/or disability status.

Figure 1: CART Segmentation Model Examining Disproportionate Impact When Prerequisite for CHEM 101 is MATH-090/C (Age, Gender, Ethnicity, and Disability Status examined).

Prerequisite Comparison pre and post implementation

[^0]| Node 0 |  |
| :---: | :---: |
| Category | \% n |
| Earned a GOR PreImplementation in CHEM-101 or CHEM-150 | 14.3737 |
| Earned a GOR Post- <br> Implementation in CHEM-101 or CHEM-150 | 85.74414 |
| Total | 100.05151 |

Note: Disproportionate Impact was not identified. Risk Estimate $=.143$, SE of Risk Estimate $=.005$, Improvement set to .01 , Child Node set to $5 \%$ of Total N unless less than 50, Parent Node is twice the Child Node.

Figure 2 uses segmentation modeling to identify disproportionate impact when MATH-095/C was and was not the prerequisite for CHEM-150. The segmentation model indicates that disproportionate impact does not exist by gender, ethnicity, age, and/or disability status.

Figure 2: CART Segmentation Model Examining Disproportionate Impact When Prerequisite for CHEM-150 is MATH-095/C (Age, Gender, Ethnicity, and Disability Status examined).

Prerequisite Comparison pre and post implementation

| Node 0 |  |  |
| :---: | :---: | :---: |
| Category | \% | n |
| Earned a GOR PreImplementation in CHEM-101 or CHEM-150 | 12.0 | 188 |
| Earned a GOR PostImplementation in CHEM-101 or CHEM-150 | 88.0 | 1374 |
| Total | 100.0 | 1562 |

Note: Disproportionate Impact was not identified. Risk Estimate $=.120$, SE of Risk Estimate $=.008$, Improvement set to .01 , Child Node set to $5 \%$ of Total $N$ unless less than 50, Parent Node is twice the Child Node.

Figure 3 uses segmentation modeling to identify disproportionate impact when MATH-103 or Eligibility for 160 was and was not the prerequisite for PHYSIC-110. The segmentation model indicates that disproportionate impact does not exist by gender, ethnicity, age, and/or disability status.

Figure 3: CART Segmentation Model Examining Disproportionate Impact When Prerequisite for JOUR-120 is MATH-103 or Eligibility for 160 (Age, Gender, Ethnicity, and Disability Status examined).

Prerequisite Comparison pre and post implementation

| Node 0 |  |
| :---: | :---: |
| Category | \% $\quad \mathrm{n}$ |
| Earned a GOR PreImplementation in PHYSIC-110 | 47.741 |
| Earned a GOR PostImplementation in PHYSIC-110 | 52.345 |
| Total | 100.086 |

Note: Disproportionate Impact was not identified. Risk Estimate $=.477$, SE of Risk Estimate $=.054$, Improvement set to .01 , Child Node set to $5 \%$ of Total N unless less than 50, Parent Node is twice the Child Node.

## Question 5: What effect did the implementation have on overall course enrollment?

To examine the effect on the implementation of the prerequisite on enrollment, the six primary terms (i.e. three years) pre-implementation were compared to the six primary terms postimplementation. Overall, the results indicated that course enrollment in the target courses increased from pre- to post-implementation of the prerequisite (see Table 6). Specifically, enrollments increased $6 \%$ for CHEM-101, $12 \%$ for CHEM-150, and $10 \%$ for PHYSIC- 110.

Table 6: GOR Earned Three Years Pre- and Post-Implementation of the Prerequisite by Term.

| Implementation |  | Course |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | CHEM-101 | CHEM-150 | PHYSIC-110 |
| Pre | Fall 1 | 104 | 59 | 14 |
|  | Spring 1 | 105 | 0 | 0 |
|  | Fall 2 | 101 | 69 | 10 |
|  | Spring 2 | 146 | 0 | 0 |
|  | Fall 3 | 127 | 60 | 17 |
