## Research Brief

## Purpose of Brief

The purpose of this brief is to examine the relationship between Crafton Hills College students who utilized the Tutoring Center from Fall 2013 to Spring 2015 and English course success.

## Summary of Findings

- Students who accessed the Tutoring Center (TC) are statistically significantly and substantially more likely to successfully complete their English courses ( $80 \%$ ) than students in the same English section who did not access the TC (66\%)

```
100%
```

- ENGL-010 students who accessed the TC are statistically significantly and substantially more likely to successfully complete their ENGL-010 course (86\%) than students in the same English section who did not access the TC (67\%)

## Overview

At the request of a Crafton Hills College (Crafton) English Faculty, the Office of Institutional Effectiveness, Research, and Planning (OIERP) examined English course performance (i.e. course success and completion rates) of students who utilized the Tutoring Center (TC) from Fall 2013 to Spring 2015. Performance outcome data was further disaggregated by course and student demographic characteristics (race/ethnicity, gender, age group, and income).

## Methodology

Dating back to the Fall 2013 semester, Crafton has managed an electronic sign-in system at the TC location that collects the student ID (SID) and the section number of the course that the student is seeking support. Collecting the course section number with the SID allowed the more methodologically sound comparison between students who utilized the TC with students enrolled in the same section who did not utilize the TC. As a result, the OIERP was able to control for term and faculty, and in some cases student skill level e.g.: ENGL-976). A limitation to the comparison between students who access the TC and students in the same section who did not access the TC was that student motivation and prior performance (i.e. GPA) were not controlled for.

In 2013-2014 (Fall 2013 and Spring 2014) 1,454 Crafton students accessed the TC for an English course, and in 2014-2015 (Summer 2014, Fall 2014, and Spring 2015) 1,240 students accessed the TC for an English course. Students accessing the TC for English were compared on course success and course completion to students who earned a grade on record (GOR) in the same English section. Course success refers to earning a grade of $\mathrm{A}, \mathrm{B}, \mathrm{C}$, or P , course completion refers to earning a grade of A, B, C, D, F, I, P, or NP (all but a "W" grade), and a GOR is a grade of $A, B, C, D, F, I, P, N P$, or W.

The effect size statistic was used to indicate the size of the difference on student course success and completion between TC English students and students who earned a grade on record in the same English section. One method of interpreting effect size was developed by Jacob Cohen. Jacob Cohen defined "small," "medium," and "large" effect sizes. He explained that an effect size of .20 can be considered small, an effect size of .50 can be considered medium, and an effect size of .80 can be considered large. Research in the social sciences has indicated that a substantial effect is considered meaningful if the effect size is .10 or higher. It is important to mention that the number of students in each group does not influence Effect Size; whereas, when statistical significance is calculated, the number of students in each group does influence the significance level (i.e. "p" value being lower than .05).

## Findings

Table 1 illustrates the English course success rate for students who accessed the TC and students who earned a GOR in the same English section and did not access the TC, referred to as the comparison group. English TC students were statistically significantly and substantially more likely to complete their English courses with a " $C$ " grade or better ( $80 \%$ ) than students enrolled in the same English section who did not access the TC (66\%). Native American students who accessed the TC were also statistically significantly and substantially more likely to successfully complete their English course (86\%) than Native American students in the same English section who did not access the TC (68\%). In addition, the relationship between TC utilization and course success, while effective with most every demographic group, appears to be most effective with Native American students ( $E S=.41, \mathrm{p}=.0005$ ), followed by students $30-34$ years old ( $\mathrm{ES}=.41, \mathrm{p}<.0001$ ), students who were not economically disadvantaged ( $\mathrm{ES}=.36, \mathrm{p}<.0001$ ), Asian students ( $\mathrm{ES}=.35, \mathrm{p}<$ .0001), and 20-24 year old students ( $\mathrm{ES}=.34, \mathrm{p}<.0001$ ).

[^0]Table 2 illustrates the English course completion rate for students who accessed the TC and students who earned a GOR in the same English section and did not access the TC, referred to as the comparison group. TC students were statistically significantly and substantially more likely to complete their English courses (95\%) than students enrolled in the same English section who did not access the TC (87\%). Students 50 years old or older who accessed the TC were also statistically significantly and substantially more likely to complete their English course (100\%) than students 50 years old or older in the same English section who did not access the TC (78\%). In addition, the relationship between TC utilization and English course completion, while effective with every demographic group, appears to be most effective with students 50 years old or older ( $\mathrm{ES}=.72, \mathrm{p}<.0001$ ), followed by students $30-34$ years old ( $\mathrm{ES}=.37, \mathrm{p}<.0001$ ), Asian students ( $\mathrm{ES}=.37, \mathrm{p}$ $<.0001$ ) and students who were not economically disadvantaged ( $\mathrm{ES}=.31, \mathrm{p}<.0001$ ).

[^1]**"p - Value" - a p-value that is less than . 05 indicates that the difference in course completion is a result of chance only 5 out of 100 times.

Table 3 illustrates the English course success rate for students who accessed the TC and students who earned a GOR in the same English section and did not access the TC, referred to as the comparison group. ENGL-976, 010, 101, and 102 were the English courses most likely to be accessed by English students. Students who accessed the TC for all four courses were all statistically significantly and substantially more likely to successfully complete their English courses than students enrolled in the same English section who did not access the TC. Of these four courses, the relationship between TC utilization and course success, while effective in almost every course, was most effective in ENGL-010 ( $\mathrm{ES}=.44, \mathrm{p}<.0001$ ), followed by ENGL-976 and ENGL-101 ( $E S=.34, p<.0001$ ), and in ENGL-102 ( $E S=.31, p<.0001$ ).
